

Solar inverter grounding test

Overview

The quickest way to do this is by isolating the DC circuits and measuring voltage from both the positive and negative conductors to ground using a multimeter. A ground fault in a solar PV system is one of the more common array issues to come across, especially in string inverter and commercial systems. This test should only be performed by qualified personnel. DC systems can carry lethal voltages. This article will overview the tools and tests technicians can use to track down a ground fault in a PV array. Technicians should have the tools, training, and protective equipment required to perform ground-fault tests. Experience from the field suggests that ground faults and arc faults are the two most common reasons for fires in photovoltaic (PV) arrays; methods are available that can mitigate the hazards.
