Airbags are inflatable cushions built into a vehicle that protect occupants from hitting the vehicle interior or objects outside the vehicle (for example, other vehicles or trees) during a collision. The instant a ...

An airbag is a crucial safety device designed to protect you during a vehicle collision. It inflates rapidly to create a cushion that absorbs impact forces, helping to reduce injuries.

Many airbag control module failures stem from electrical issues within the vehicle. Drivers might experience intermittent electrical problems throughout their vehicle when the module begins to ...

Airbag systems are essential innovations in automotive safety, designed to protect occupants in collisions. They employ crash sensors, control units, and inflatable bags to deploy ...

The top five causes of airbag failure include faulty airbag sensors and wiring, inadequate airbag system maintenance, crash data recorder malfunctions, airbag module software issues, and ...

Learn about the safety benefits of frontal and side airbags and how to safely position yourself and passengers to avoid an airbag related injury.

Airbags are considered passive restraints because they activate automatically during a collision. Unlike seatbelts which require you to buckle up, airbags are designed to work precisely ...

Understand why a vehicle's airbag module fails and how to repair them quickly and easily.

It consists of an airbag cushion, a flexible fabric bag, an inflation module, and an impact sensor. The purpose of the airbag is to provide a vehicle occupant with soft cushioning and restraint during a ...

In this blog, we'll break down what the airbag control module does, the common signs of failure, where to

Airbag system reports ECU internal energy storage failure

find it, and what to do if you suspect it's going bad.

Federal officials are issuing an urgent warning to used-car owners across the country after discovering potentially deadly replacement airbags installed in vehicles following previous crashes. ...

Like seat belts, the concept of the airbag -- a soft pillow to land against in a crash -- has been around for many years. The first patent on an inflatable crash-landing device for airplanes was filed during ...

EEPROM stands for Electrically Erasable Programmable Read-Only Memory. It's a small memory chip found in almost every electronic control module (ECM, TCM, ICM, BCM, SRS/Airbag, ...

When battery is lost, the Airbag ECU draws current (I) from the capacitor (C). When the voltage across the capacitor falls below a threshold, writing of EDR stops. CLEPA recommends ...

Failure to Deploy: If the ECU cannot correctly interpret collision signals, the airbag may not deploy, significantly increasing the risk of injury or fatality.
