Why do we need a control system for microgrids?

High penetration of Renewable Energy Resources (RESs) introduces numerous challenges into the Microgrids (MG), such as supply-demand imbalance, non-linear loads, voltage instability, etc. Hence, to address these issues, an effective control system is essential.

What is a microgrid?

Microgrids (MGs) represent one outcome of this transformation. The MG represent a compact power system comprising of independent renewable energy resources (RERs), energy storage systems (ESSs), and loads operating as a unified control system to generate power for localized areas within the range of 10-100 MW [3,4].

How to overcome the challenges of microgrid systems?

Various strategies have been used to overcome the challenges of microgrid systems, such as energy balance, voltage and frequency stability, load forecasting, cost reduction, and fault diagnosis . Optimization techniques as control strategies can be classified into mathematical and metaheuristic techniques.
