Upwind turbines--like the one shown here--face into the wind while downwind turbines face away. Most utility-scale land-based wind turbines are upwind turbines. The wind vane measures wind direction ...

All wind turbines turn clockwise when view from the wind direction due to the aerodynamic properties of the blade design. The blades on the turbines can rotate on the hub itself, so they may ...

When wind flows across the blade, the air pressure on one side of the blade decreases. The difference in air pressure across the two sides of the blade creates both lift and drag.

When winds reach the rated wind speed VR, the generator delivers as much power as it is designed for. Above VR, there must be some way to shed some of the wind's power or else the generator may ...

Usually, wind turbines like to face the wind. They can rotate 360 degrees to make the best use of whatever wind is available. A wind turbine receives the most wind energy if it is facing directly into ...

The direction that the blades are facing can be rotated so that the turbine always faces into the wind, and the pitch of the blades (the angle at which the blades face into the wind) can also be adjusted.

In these types of wind turbines, the axis of rotation is horizontal, and the aero turbine plane is vertically facing the wind. A common type of wind turbine with a horizontal axis is shown in ...

Wind direction: This is an "upwind" turbine, so-called because it operates facing into the wind. Other turbines are designed to run "downwind," facing away from the wind.
